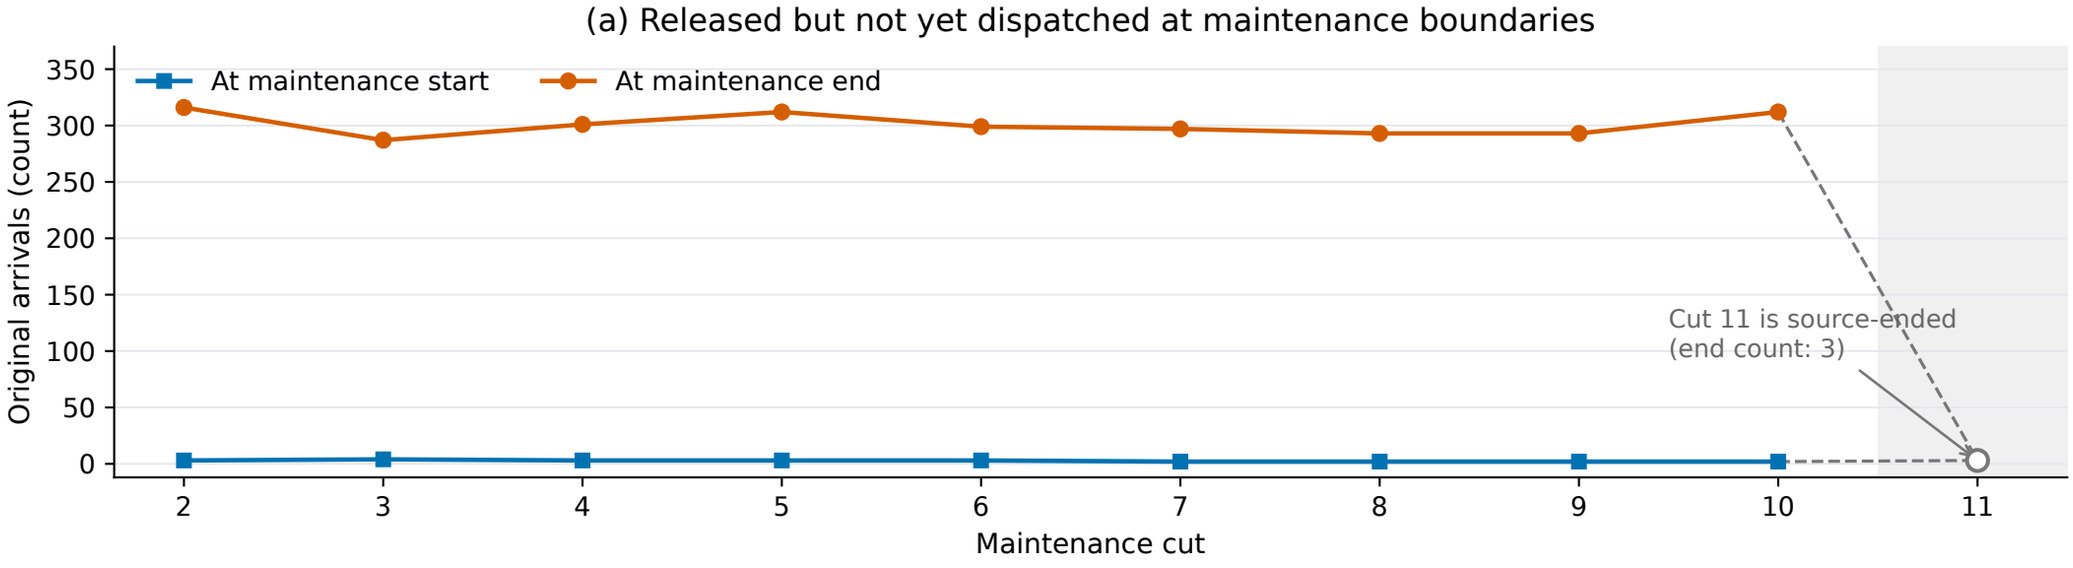
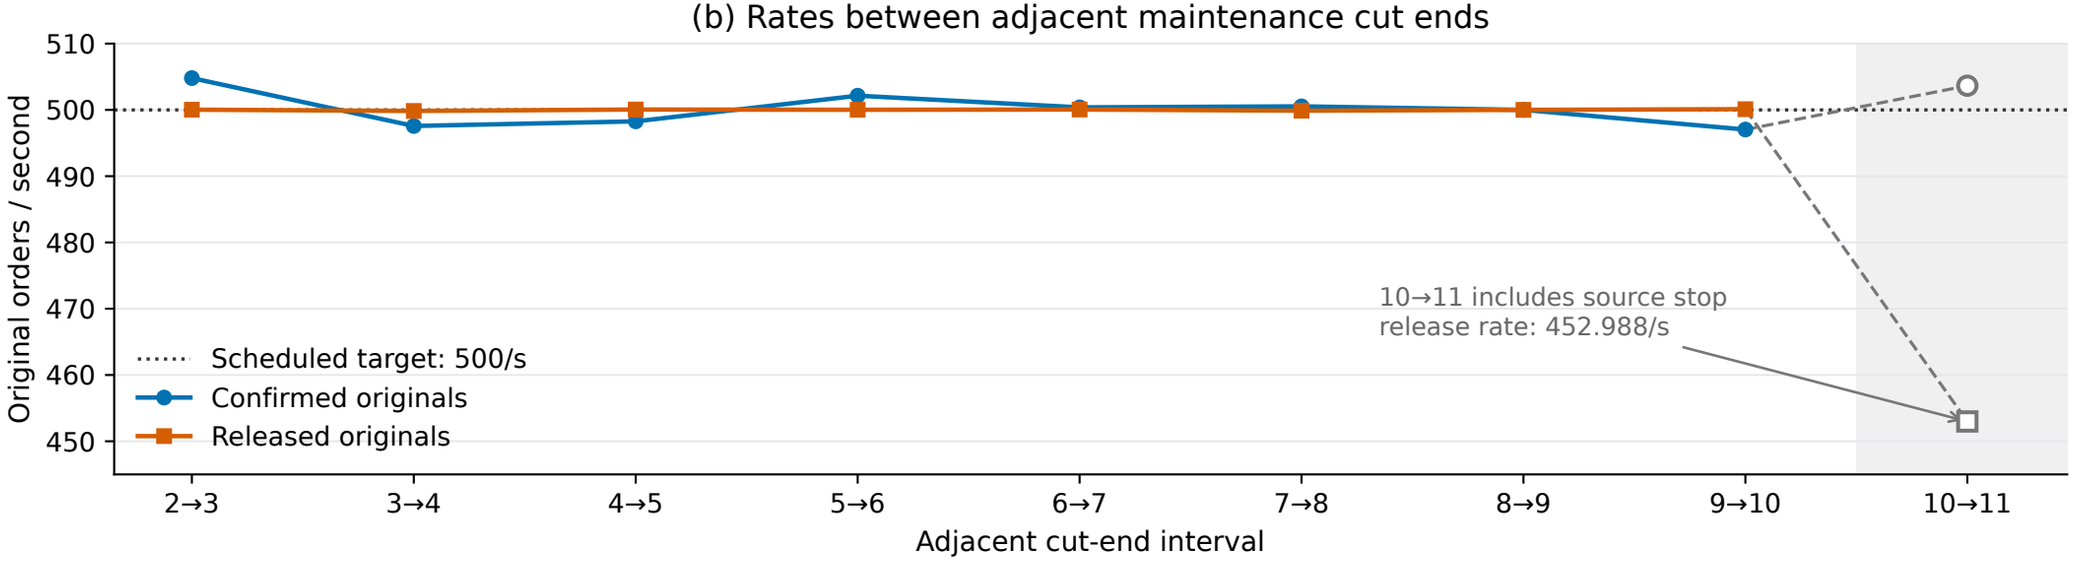
Finite long-cut run: backlog and phase-matched rates

500 scheduled orders/s | 33,792 original arrivals | one host, three Aeron node processes



Logical timestamp count; not physical owner queue occupancy.



Intervals are (previous cut end, current cut end]. Grey hollow points are censored by the finite source stop.

Fully offered span: cut ends 2→10, 49.144 s; confirmed 500.080/s, released 499.999/s; backlog drift −4.

Finite observation only. The cut-11 backlog decrease does not demonstrate recovery under ongoing 500/s input.
